Three segments, one priority: shoppers already managing a condition

	PRIORITY **A · Condition managers** Adults ~45–60 advised to cut sugar or salt; shop online weekly *23.8% raised BP · 3.1% diabetes (measured)*	**B · At risk, not diagnosed** Adults with a known risk factor who want to prevent illness *27.9% of adults overweight or obese*	**C · Unaware majority** Weekly online shoppers with no felt health risk *Only 6.0% meet fruit & veg minimum*
Problem severity and frequency	High: every weekly basket; a wrong pick has a health cost	Medium: rising risk, but no rule to follow	Low felt: the problem exists but goes unnoticed
Current behaviour or workaround	Memorised avoid-lists, small-print labels, asking family or a clinician	General “healthy” rules of thumb and pack claims	None: buys on price and habit
Access to alternatives	Pack labels only; no online signal; added sugar not mandatory	Same, with no personalised guidance	Same; nothing prompts them to look
Role in the health system	Secondary prevention: diagnosed, following advice	Primary prevention: the group national targets aim to reach	Primary prevention: the undiagnosed majority
Digital access and willingness to pay	Already shops online; desktop vs app and payment to confirm	Likely confident; payment to confirm	Confident, but little pull to install
WHY SEGMENT A	**Strongest felt need.** They act on sugar or sodium every shop, and our thresholds mirror their rules.	**Poorest alternative.** Labels only, incomplete, and no signal on any Kenyan online store.	**Most testable.** They can retell their last shop; segment C cannot be interviewed about a problem it does not feel.

Validation: two conversations with priority-segment shoppers

V1 age band · area · how they shop	
What they currently do	*INSERT V1*
Biggest pain point	*INSERT V1*
Current alternative or workaround	*INSERT V1*
Why the problem matters to them	*INSERT V1*
What contradicted our assumptions	*INSERT V1*

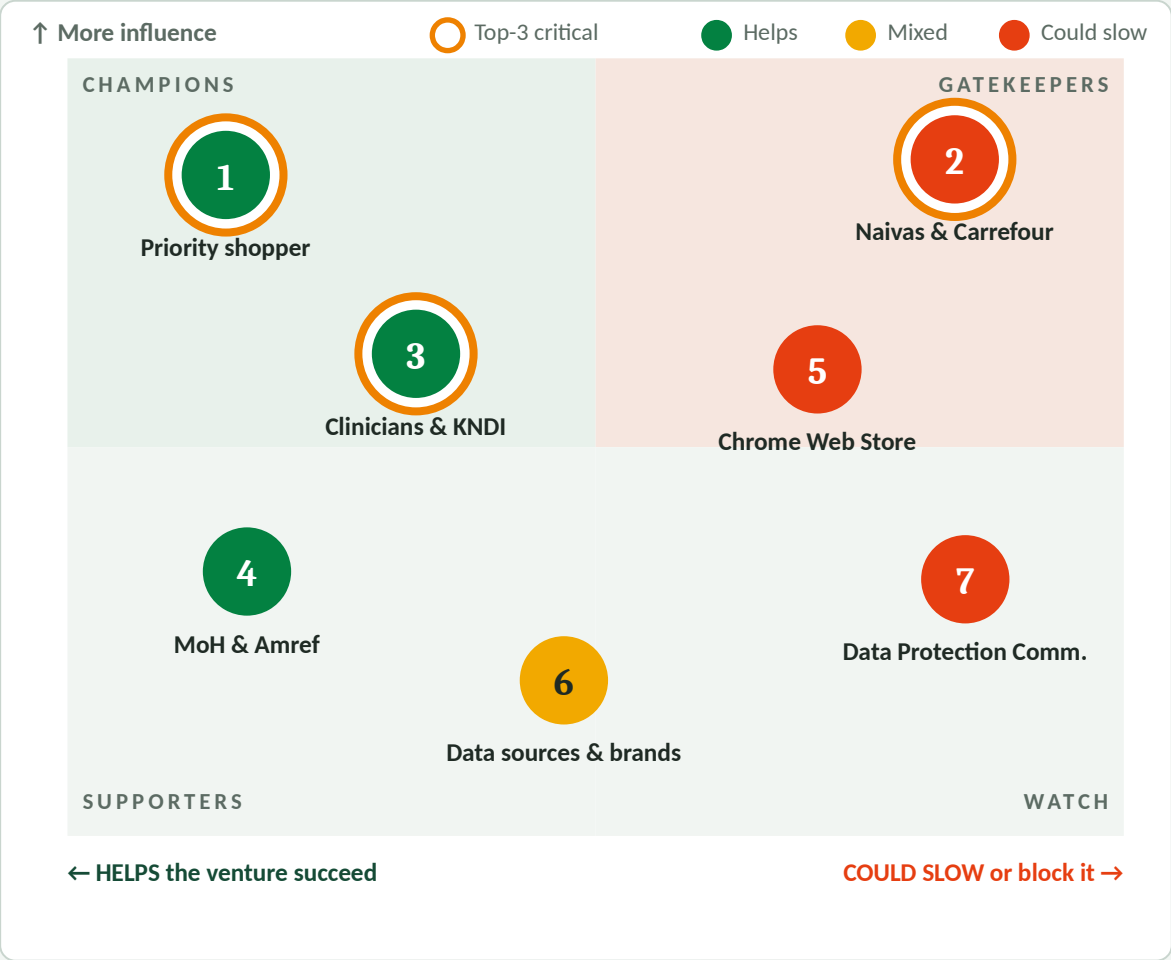

V2 age band · area · how they shop	
What they currently do	*INSERT V2*
Biggest pain point	*INSERT V2*
Current alternative or workaround	*INSERT V2*
Why the problem matters to them	*INSERT V2*
What contradicted our assumptions	*INSERT V2*

TEST AGAINST EACH CONVERSATION

- Feels the problem on most weekly shops
- Shops in a desktop browser, not just an app
- Relies on outside advice today (clinician, family)

At least two conversations with people from segment A. Anonymise: no names, no diagnoses.

Seven stakeholders decide adoption, access and credibility

#	Stakeholder	Role in the ecosystem	Influence on the venture
1	**Priority shopper (segment A)**	Primary user	Adoption and continued use
2	**Naivas Online & Carrefour Kenya**	Storefronts the tool runs on	Access; can break or block it
3	**Clinicians & dietitians (KNDI)**	Advisers and validators	Trust, referral, threshold endorsement
4	Ministry of Health & Amref	Public-health partners	Legitimacy, reach, funding route
5	Chrome Web Store (Google)	Distribution channel	Listing approval, permissions review
6	Data sources & food brands	Nutrition data supply	Grade coverage and accuracy
7	Data Protection Commissioner	Regulator	Compliance on health-related data

MOST CRITICAL 1 Shopper (adoption) · 2 Retail platforms (access) · 3 Clinicians (trust)

Map positions are the team's current judgement and will be tested in the first stakeholder conversations.

One stakeholder risk, one change, one honest reflection

MAJOR STAKEHOLDER RISK

Retailers hold the switch

The tool reads Naivas and Carrefour pages without a partnership. A site redesign, or a retailer objecting to a third-party grade beside its products, could break or block it overnight.

64% of our 10,518 product records sit behind one retailer, Carrefour Kenya

MITIGATION

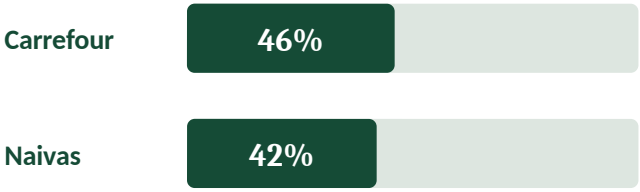

Open a low-ask pilot conversation early, and keep each retailer's adapter isolated so one change does not stop the other.

ONE CHANGE WE WOULD MAKE

Curate what segment A actually buys

Only 42–46% of catalog records can show a grade today. Ask each interviewee to show their last cart, then verify those products first, so the grade appears on the items they really buy.

RECORDS THAT CAN SHOW A GRADE TODAY

54% of all records are still unverified

FINAL REFLECTION · WHAT HAS CHANGED?

Working answer, before interviews

- The user narrowed: from all online shoppers to shoppers already managing a condition.
- User and payer differ: shoppers benefit, but no payer is identified yet.
- Retailers moved from data source to gatekeeper.

INSERT what the interviews confirmed or contradicted, and whether the direction stands.

Shipped v1.1.0 datasets: Carrefour 3,094 of 6,698 and Naivas 1,609 of 3,820 records can display a grade; 5,660 of 10,518 are UNVERIFIED.
